

FrontRetail

New features
in version 2010

Cash control and service planning

Block and auditing of open cash drawer

If the cash drawer allows for it, **FrontRetail** can be blocked whenever the cash drawer is open, so that the user cannot perform any other action until the drawer is closed. You can also configure to emit a sound whenever the cash drawer is open for more than x seconds. The open cash drawer incidents will furthermore be logged in the audit.

Control safes

This version not only controls the cash money in the cash drawers of the POS, but also controls the balance of the safe of the establishment. If **FrontRetail** uses a safe, the cash outs will automatically increase the balance of the safe. The safe is controlled from **ICGManager** and can be configured so that several terminals of an establishment share a safe, even though each till works on an autonomous database. Furthermore, from each terminal you can make money transfers from the safe to the bank and backwards.

New cash closing functions

There are two ways to make a cash closing: with or without cash declaration. If no cash declaration is made, **FrontRetail** automatically transfers the calculated amount to the safe, and when a cash declaration is made it will transfer the declared money. Anyway, the safe control system allows you to recount the cash money transferred to the safe afterwards.

New service calendar and sale of packs

A new service calendar completely integrated in **FrontRetail** where the user can see all services to make and where you can assign date and time to new services. The new functionality for the sale of packs lets you invoice and collect in advance a set of services. These services will be pending and can be realised in the future in any of the stores of the chain.

Manage parking barriers

Incorporates a new system to control the parking barriers. From a Point of Sale of an establishment you can read the parking ticket with a magnetic stripe card reader or barcode reader and print the sales ticket with a barcode at the bottom to open the parking barrier.

More powerful management of price rates and promotions

In the configuration of the Fronts you can define the start and end dates of a price rate (allowing to use the same offer rate in different periods per Front). There are also some additional Mix & Match promotions.

New customer loyalty options

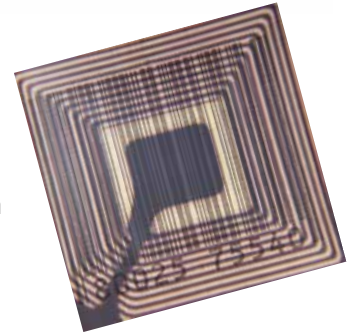

Offers loyalty cards with alphanumerical codes. Includes a function to search cards by customer name, the use of prepaid cards and an extract of items bought with a specific card.

Interpretation of more barcodes from external scales

Allows to define and interpret more than two barcodes from external scales.

Item identification through RFID

Includes a system to identify items by radiofrequency, which offers the maximum security. In fashion stores an alarm system is used to codify the item by RFID. When removing the alarm system at the counter, the item will automatically be registered in **FrontRetail**.
